# Introduction

- ★ The MNIST database is a large database of handwritten digits that is commonly used for training various image processing systems.
- ★ This dataset is one of the most common datasets used for image classification and accessible from many different sources.

## Design

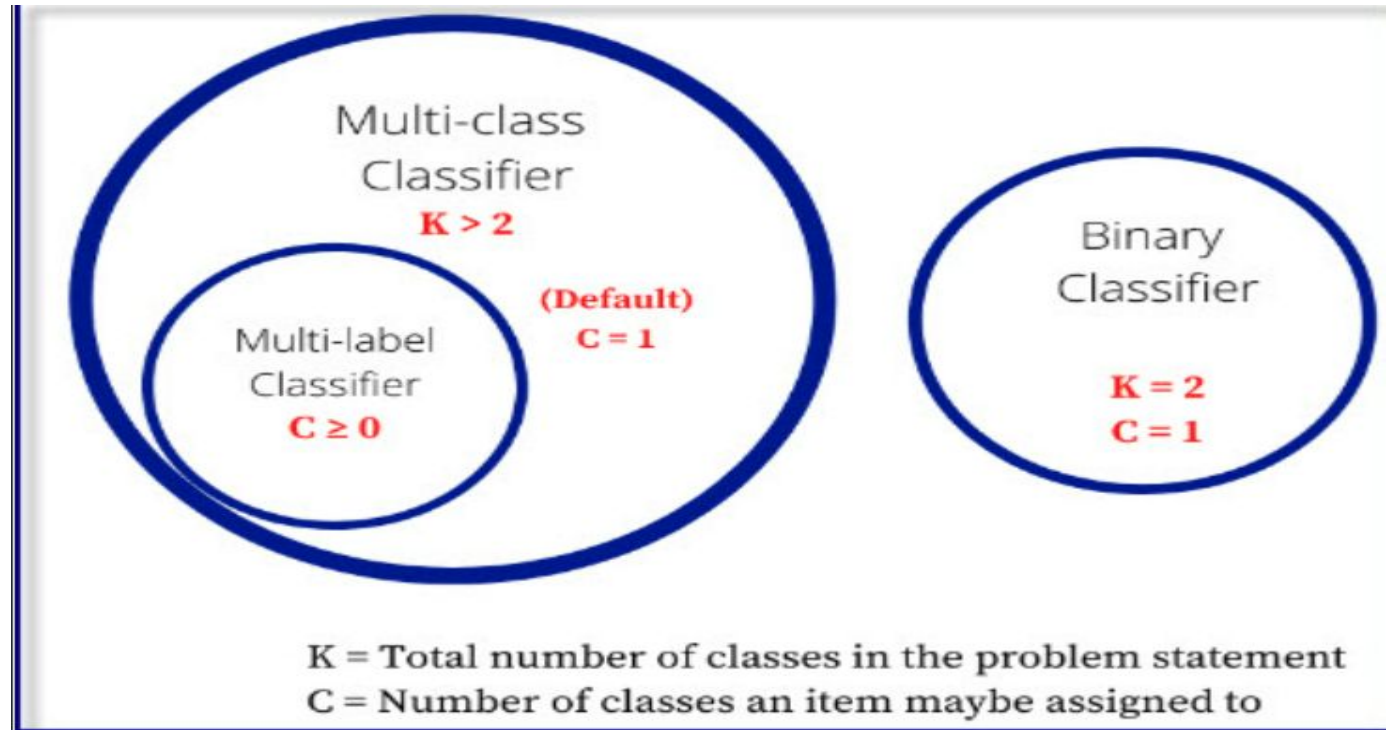

5	0	4	1	9	2	1	3	1	4
3	5	3	6	1	7	2	8	6	9
4	0	9	1	1	2	4	3	2	7
3	8	6	9	0	5	6	0	7	6
1	8	7	9	3	9	8	5	9	3
3	0	7	4	9	8	0	9	4	1
4	4	6	0	4	5	6	1	0	0
1	7	1	6	3	0	2	1	1	7
8	0	2	6	7	8	3	9	0	4
6	7	4	6	8	0	7	8	3	1

# Design

**Scalable multi-output label prediction: From classifier chains to classifier trellises**

# Design

**Multiclass v/s Multilabel classification**

# Design

Low Accuracy  
**High Precision**

**High Accuracy**  
Low Precision

**High Accuracy**  
**High Precision**

# Implementation

- ★ Go to [Colab](#)
- ★ Execute [classification.ipynb](#)

Test

# Test

Saving figure precision\_recall\_vs\_threshold\_plot

# Test

Saving figure precision\_vs\_recall\_plot

# Test

Saving figure roc\_curve\_plot

## Test

## Enhancement Ideas

- We can use Batch normalization technique that normalizes the activations of the layers in the model, making the training process more stable and faster. We can try adding batch normalization layers to the model to improve its performance.

## Conclusion

- By using the MNIST dataset, we can easily train and evaluate a model that can recognize handwritten digits. The enhancements discussed in this answer, such as changing the model architecture, adding regularization, using data augmentation, and performing hyperparameter tuning, can help you improve the performance of the model.
